

# Homework 1

Brady Lamson

1/28/2022

## Problems 1-5:

### Problem 1:

- a) Try the commands `pi`, `round(pi)`, `round(pi, digits = 4)`, and `trunc(pi)`, `ceiling(pi)`, `floor(pi)`. What are the results?

```
## The output of pi is 3.14159265358979
```

```
## The output of round(pi) is 3
```

```
## The output of round(pi, digits = 4) is 3.1416
```

```
## The output of trunc(pi) is 3
```

```
## The output of ceiling(pi) is 4
```

```
## The output of floor(pi) is 3
```

- b) Try the commands `sqrt(16)`, `16^0.5`. Are the results the same?

```
## The output of sqrt(16) is 4
```

```
## The output of 16^0.5 is 4
```

```
## Are the two commands the same? TRUE
```

- c) Write a command that computes  $4^3$

```
4^3
```

```
## [1] 64
```

- d) Try the commands `log10(1000)`, `log(1000)`. Try the command `log2(64)`. What are the results?

```
## The output of log10(1000) is 3
```

## The output of `log(1000)` is 6.90775527898214

## The output of `log2(64)` is 6

e) Does the text of the help file for `log()` match your observations?

- Yes it does! The number next to the log is the base, so `log 10` uses a base of 10. The one thing to keep in mind is that `log()` uses a base of e by default (`exp(1)` in R).
-

## Problem 2.

Manipulate the following character vector using square brackets [ ] to accomplish the following goals.

- 1) Barry arrives (and gets in the last position of the line)
- 2) Steve is served (and so he leaves)
- 3) Pam arrives and talks her way to the front of the line (with just one item)
- 4) Barry gets impatient and leaves

```
queue <- c("Steve", "Russell", "Alison", "Liam")
queue[length(queue) + 1] <- "Barry"
queue <- queue[-1]
queue <- c("Pam", queue)
queue <- queue[-length(queue)]
queue
```

```
## [1] "Pam"      "Russell" "Alison"  "Liam"
```

---

### Problem 3.

- a) Write a command that lists the objects in your Workspace.
- b) Write a command that removes x from the Workspace.
- c) Write a command that removes *\*all\** the objects from your Workspace.

```
w <- 6  
x <- 7  
y <- 8  
z <- 9
```

```
ls()
```

```
## [1] "queue" "w"      "x"      "y"      "z"
```

```
rm(x)  
rm(list = ls())
```

---

## Problem 4

Consider the below vector.

a) What is the output of `x == 0`

```
x <- c(3, 2, 0, 1, 4, 5, 9, 0, 6, 7, 2, 8)
x == 0
```

```
## [1] FALSE FALSE TRUE FALSE FALSE FALSE FALSE TRUE FALSE FALSE FALSE
```

b) Write a command involving `sum()` and the “logical” vector `x == 0` that counts the number of elements of `x` that are equal to 0.

```
logical_vector <- x == 0
```

```
## The output of sum(logical_vector) is 2
```

c) Write a command that determines the *proportion* of elements of `x` that are equal to 0, assuming you *don't know* the number of elements in `x`.

```
proportion <- (sum(logical_vector) / length(logical_vector)) |>
  round(digits = 3)
```

```
## The proportion of elements of x that are equal to 0 is 0.167
```

---

## Problem 5:

Using the following data frame:

```
numVec <- c(2, 4, 6, 5, 9, 8, 2, 4, 7, 8)
charVec <- c("a", "b", "c", "c", "b", "c", "a", "b", "b", "c")
myData <- data.frame(x1 = numVec, x2 = charVec, stringsAsFactors = FALSE)
```

a) The following commands do the same thing:

- `myData$x1`
- `myData[["x1"]]`
- `myData[[1]]`

What do they do?

- These return the first column of the data set, which in this case is all of `numVec`.

b) What kind of object is returned by the commands in part a?

```
is.vector(myData$x1)
```

```
## [1] TRUE
```

If they return a *vector*, what type of vector is it?

```
glue::glue("
  Is myData$x1 a numeric vector or character vector?
  Numeric? {is.numeric(myData$x1)}
  Character? {is.character(myData$x1)}
")
```

```
## Is myData$x1 a numeric vector or character vector?
## Numeric? TRUE
## Character? FALSE
```

c) What do the following commands do?

```
myData[2, ]
```

```
##   x1 x2
## 2  4  b
```

```
myData[, 2]
```

```
## [1] "a" "b" "c" "c" "b" "c" "a" "b" "b" "c"
```

`myData[2, ]` returns the second row of the data frame. So (4, b)

`myData[, 2]` returns the second column of the data frame. This will be the full vector of characters.

d) What class of object is `myData`?

```
glue::glue("myData is of class {class(myData)}.")
```

```
## myData is of class data.frame.
```

e) What happens when you pass myData into the summary() command?

```
summary(myData)
```

```
##           x1           x2
##  Min.      :2.00   Length:10
##  1st Qu.:4.00   Class :character
##  Median :5.50   Mode  :character
##  Mean     :5.50
##  3rd Qu.:7.75
##  Max.     :9.00
```

This command provides the summary statistics, length, class and mode. \*\*\*

# Textbook Exercises

## B.2

```
example(mean)
```

```
##  
## mean> x <- c(0:10, 50)  
##  
## mean> xm <- mean(x)  
##  
## mean> c(xm, mean(x, trim = 0.10))  
## [1] 8.75 5.50
```

## B.9

## B.4

```
find("mean")
```

```
## [1] "package:base"
```

```
library(Hmisc)
```
